**What Is Chromatic Aberration?** Chromatic aberration is the inaccurate representation of colors due to the non-uniform transition of wavelengths within the electromagnetic spectrum. This is a common problem with digital photography. The digital sensor picks up a rainbow spectrum of light, and a series of buffers in the system work together to try to reproduce what they think is the correct color. Unfortunately, as a result, this rainbow spectrum colors the image, which can make it look bad, especially when you use post-processing to try to fix it. Smart Blur Chromatic aberration can be fixed by blurring the photo, which will make the rainbow artifacts less apparent. You can do this with the Smart Blur filter, which is located in the Filter Gallery. Smart Blur is a great tool for removing chromatic aberration, but can be a little confusing if you don't know how to use it, so you might want to start with Photoshop's basic tutorial first. Remove Chromatic Aberration Open the photo you want to use Select the Filter → Blur → Smart Blur tool. Adjust the settings, such as Amount and Radius Click OK to apply the filter Removing Chromatic Aberration - Basic Tutorial There is a more detailed tutorial on how to use the Advanced Smart Blur Filter. Patchy Texture Patchy texture appears as a scruffy, rough-looking surface that cannot be corrected with any of the traditional fix-up techniques. Patchy texture is the result of high contrast and an uneven light source. If you have a surface that looks this way, you can fix it with the Pencil tool and/or Content Aware Fill. Both the Pen

The history of the discovery of a new species of tree fungus, a fungus that parasitises poplar trees in New Zealand, can be traced back almost 100 years and, it is believed, is a new species. This fascinating discovery has been described by botanist Dr. Rebecca Jenner in the journal *Phytotaxa*. The discovery was made over the last few years while conducting a range of experiments related to the evolution of key trait loci in poplar trees. “Many years of research have led to the discovery of this new species and our discovery could significantly change how botanists, foresters and plant breeders approach tree species,” says Dr. Jenner, an assistant professor in the department of Botany in the College of Science and Health. Dr. Jenner and her postdoctoral researcher, graduate student and fellow botanist, “Yada” Smith, conducted their research in Canterbury, and worked in collaboration with researchers at the UNITE Graduate School of Plant Sciences, Massey University. The fungus is best known for its parasitic ability to attack poplar trees. Poplars are widely planted in New Zealand and it’s a common sight to find them at school playgrounds, parks and the edges of roads. “This is a major discovery because, not only does it change how we might approach the evolution of traits in poplars, but it has the potential to affect the use of poplar forestry in New Zealand,” says Dr. Jenner, who is passionate about informing people about plant life and how it works. “It is amazing to think that, without the chance discovery of these trees by her son, it would have taken this long to come to light. It was discovered almost 100 years ago – and yet, she remains the first person to formally describe it.” Dr. Jenner says she intends to apply for it to be named the ‘caesioria celata’ or ‘caino’ in her honour. Her name is already too long so she has always been searching for a unique name. “It is a real honour to be the first person to discover the new species and the naming rights belong to my son and family,” she says. The species, ‘caino’, was first described in 1907, by W. G. Eccarius in the journal *Zeitschrift f*

### What's New In?

4.1. Ransomware The common tool for ransomware attack is a malicious program. This program encrypts the files on a system, or renders them unreadable. Once the program encrypts the files, there is no way of saving the files in their current format without paying the ransomer a ransom. Some organizations are willing to pay ransomer to regain access to their data, and many online services provide payment services. Other organisations have their own policy that requires payment or risk losing the files, and any user that does not pay loses access to their files.

4.1.1. Types of Ransomware Some ransomware programs display the ransom message only on the desktop or are not very user-friendly. Ransomware programs can also damage or delete files, render the system unusable, and prevent the user from accessing files.

4.1.1.1. Crypto-Ransomware It is not rare to come across malware that is delivered by email messages or attachments. Crypto-Ransomware encrypts files (and/or the system) and displays a ransom message. To avoid this kind of Ransomware, make sure you only open attached files from legitimate sources.

4.1.1.2. Social-Ransomware Social-Ransomware is a newly developed malware. It does not encrypt files, but generates fake social network logins, such as Facebook, YouTube, Instagram and Twitter. This fake login is used to send a fake message that a user has to pay a ransom, and then the malware decrypts the files.

4.1.1.3. Unknown Ransomware Because of the encryption technology used and the way it is targeted, you might not be able to determine the exact name of the Ransomware program you have. This is why you should always run a reliable anti-virus program. Ransomware is a serious problem for IT security. Prevent ransomware attacks with real-time help and support from iYogi experts. 4.2. Fake Anti-Virus There are several types of Fake Anti-Virus (F.A.V.) programs. The most common ones are trojan programs that display a security warning message, but once you click OK, the trojan will install other unwanted applications, and it might not even be Fake.
