Arch1. Field of the Invention The present invention relates to noise suppression. More specifically, the present invention relates to medical systems and devices for the detection, prevention, and control of noise in the vicinity of an ear or teeth that may be harmful to health or cause discomfort.

2. Description of the Related and related communications industry over the last several years has progressed to a very high level of sophistication, and has become one of the fastest-growing moving industries in history. In many respects the value of the information is so great, such as security-related information, and more general information. One important attribute of an information communication process is "noise." "Noise" is a broad term that covers various types of message information that is not intended to be decoded or interpreted by the intended recipient of the message. Since such messages are not intended for the recipient, the level of noise is comparable to that of a loud siren outside the intended message frequency range. For example, noise may be produced by any of the parties to the communications process, and, also, by the manner in which the message is transmitted. Transmitters may be of many types, including those transmitting modulated information over a communications medium. For example, FM radio transmitters may broadcast in the 200 Hz to 20,000 Hz range, and may also be amplitude-modulated. In telephony, transmitters may use technology like POTS, T1, E1, PRI, or ISDN. Other types of communications such as X.25 may use, for example, F-DMPS and F-TCP, as well as data technology such as TCP/IP. Cable or satellite communications may also produce noise at various frequencies. One example of such noise is the superposition of the information and of the transmitted communications signal onto the same physical link. The noise is like that of a narrowband carrier in a broadband signal. This noise, also called "guardband" noise, may also have various causes, which may include other transmit such as the co-channel noise, co-site interference, and the like. A complete description of the various types of noise associated with telephone transmissions is provided in the publication entitled "The Telephone and its

Transmission Network", by Willis F. Hurd, published by Van Nostrand, Inc., South Burlington, VT, 1975, a copy of which is supplied with the patent application. Noise may also be produced at the receiver. As discussed above, noise that is
