Fluids can include natural gas, propane, butane, or other gases. The fluids can also include liquids such as oil, water, brine, asphaltenes, and other substances. In one approach to enhance hydrocarbon production, a matrix of proppant is introduced to the subterranean reservoir to increase the ability of the hydrocarbons to flow into the well bore. In one approach, a well bore is drilled from the surface to the subterranean reservoir. Then, the proppant is introduced into the well bore as a slurry of proppant in a fluid such as water, oil, or other suitable fluid. The proppant-fluid slurry is flowed from the well bore into the reservoir, causing the proppant to settle out in the reservoir and form a propp a1d647c40b

Biogenic polymers are the most abundant and successful in the search for a tissue engineering scaffold. However, they lack in a chemical cross-linking density needed to sustain and integrate tissues. We have developed a biostable and biofunctional self-assembling template material using a series of polyester diols based on a simple oxyethylene block co-polymer. The first compound was synthesized with the aim of altering the biogenic hydrogels' morphology. The polymer's X-ray diffraction pattern and FT-IR spectroscopy revealed the presence of terminal groups and a cross-linked polymer network,
