the mirror box and the electrical box. I flipped the walls upside down and propped them up on a board to make sure they would stick and also make sure there was no caving or warping. I attached the mirror box to the wall and also attached the electrical box to the wall and laid all the wiring in the box. I then took some rubber-bonded wire strippers and pulled the old wiring out and trimmed them down so they would fit. I routed out all the wiring, ran it through the box, and bent it out of the way of the mirror. That part was done. Step 6 – Let It Dry! I found a sticker on eBay with a timer on it. I took it off the box and placed it in the mirror box. I put a suction cup around the back of the mirror and attached it to the window using more of the adhesive strips. I checked the window every couple of days until the window was completely dry and the adhesive was fully cured. I checked the mirror to make sure the reflection was symmetrical and adjusted it if needed. Final Thoughts Overall, this was a pretty straight-forward project. The hardest part of this project was attaching the mirror to the window. The mirror was very heavy and I had to be careful with the angles. It took me almost an hour and a half to attach it, but the great thing is that it all went really well and I have a cool piece of art to display in my living room! Again, I am sorry I never get to use the space this mirror box is in. It is amazing how all the cleaning and dust it collects really helps me to see the reflections that I am not looking for. I would definitely recommend this mirror box to anyone that needs a place to hang a mirror. I think it would also be a great addition for hanging art. You can find this mirror box for sale on eBay for \$25.Q: Using geocoder to find nearest location to current location Currently using google maps V3 API with my code below, which works fine but, I don't know if the returned location is a correct one, and it makes me query the database each time the location changes, is there a way that I can store the location in a variable and use that instead of the geocoder function? function getLocation() { if(nav
