**The Basic Workspace** The tools palette offers many options for organizing the areas where you work in your image. They are organized by layers, and you can organize them as a thumbnail panel, a stack, or both. The stacks allow you to place several images in a single thumbnail panel. So, for example, you can have one stacked panel for work you're doing on an image, another stacked panel for work that is saved for a different image, and so on. Any image you save has layers you can drag into other panes. The image can be edited on its own layer; and all layers can be edited on their own layers. You can also use masking tools to layer effects and mask shapes. When you create a new file, you can apply the Project Options to automatically save it as a set of layers. Project Options work to make your image compatible with both print and web publishing. Before you start your work, make sure that you don't have other applications open that do not give you a Lock Canvas button. This will lock the active canvas so that you can work without having to stop and restart your work. If you are working on an image that's already open in Photoshop, the Image Canvas Tab in the Editor at the bottom of the screen will give you a Lock canvas button. Figure 1.6. The Image Canvas Tab in the Editor You can also drag the layers from other panes directly into the active canvas window. This move the active layer into another image. You can then use the Free Transform tool (M) to distort the layer to conform to the image it is in, while leaving all the other layers alone. Figure 1.7. A layer moving into another image A single image can use up to 30 layers. If you have a large number of layers, you can collapse them and organize them into stacks

[Medical consumption and medical costs in human trafficking]. This paper analyzes the consumption of healthcare services in the context of a labor trafficking case, through the analysis of medical records taken from the patients. Case study, qualitative research, descriptive, transversal, quantitative. The study involved the collection of medical records of patients from the Public Health System (SUS) corresponding to the hospitalization unit for labor trafficking that occurred from January to December of 2011 in a specialized health care center in the capital of the state of São Paulo. The information was obtained from the medical records taken from the patients. The data were organized using Excel software and exported to the statistical software for analysis of the results. It was observed that 96.8% of patients attended the medical care in 11 months, while only 3.2% were interned for more than 11 months. The consulting time ranged from 3 to 12 months, with a mean of 6 months. It was observed that 66.7% of patients were examined in the outpatient clinic and 33.3% in the emergency care unit. The most frequent diagnoses were: hair loss (26.7%), bronchitis (26.7%) and diarrhea (21.7%). The utilization of healthcare services was attributed mainly to the lack of social security, since the poor living conditions of the workers may force them to seek medical attention.Q: Using C# and MongoDB how can I use child Document IDs for document ID within an array? I've got a pretty simple problem, I've got a database in MongoDB with collections of documents, where within a given document a certain field can be either a zero, one or multiple other documents with the same ID. So for example, the mongo document could look like this: { "_id": "id1", "name": "Project 1", "type": "person", "childDocuments": [ { "_id": "id2", "name": "John Doe", "type": "person", }, { "_id": "id3", "name": "Jane Doe", "type": "person" }, { "_id": "id4",
