In strongly disordered spin and fermion systems quantum dynamics is hard to define. Despite being delocalized, eigenstates show nonclassical properties, such as enhanced energy fluctuations or logarithmic entanglement growth. These signatures of localization are too weak to be detected using standard spectroscopies. However, their effects can be amplified by quantum probe observables. Here we study how probes couple to an initially localized state in the presence of disorder. We compute the temporal response of the probe operator to a pulse excitation and find that a disorder-induced many-body localization of the initial localization wave packet, leading to a logarithmic response, persists until the probe reaches the boundary. We also show that the probe dynamics in this regime can be described within the framework of the generalized eigenvalue problem of a non-Hermitian Hamiltonian. Our work is directly applicable to quantum simulation using disordered spin-1/2 systems, where measurements of local observables in a probe wave packet can be used to investigate many-body localization.Exendin-4 upregulates the expression of glucagon and somatostatin in islet cells of Zucker diabetic fatty rats. role of the MAPK pathway. The Zucker diabetic fatty (ZDF) rat is a diabetic animal model showing islet hyperplasia and elevated glucagon and somatostatin contents, along with abnormal glucagon secretion. We show in this work that the pancreatic islet content of somatostatin mRNA and protein decreased, and that the amount of glucagon increased in 6-week-old rats. These data were accompanied by an increased amount of pancreatic insulin mRNA and a decrease in the insulin content. The increased islet contents of glucagon and somatostatin were unaffected by the treatment of ZDF rats with anti-diabetes drug glimepiride, a specific sulphonylurea, which 3da54e8ca
