pdf, 1.32 MB; Import NC file, 0.24 MB; Comparison of conventional non-circle turning with CNC, 0.96 MB ; Swan N.C. Simulation. Article in ODT. It states that a CNC program is developed according to the following principles: The design of the program should be based on how the material is actually processed, and not on what the result is expected to be. The result of the program should be accurate, fast and inexpensive movement of tools in accordance with a given project. In this case, the removal of thermal energy is necessary to perform a more accurate movement of the tool, and this, in turn, is necessary to reduce the cost of manufacturing parts. Processing must be carried out within a reasonable time and at the lowest possible cost. The program should use standard actions (gears and stars) in an accurate and realistic interface. For each command, data must be created and carefully worked out for more accurate programming of the program. When executing the program, perfect software tools must be used. The result of the program execution should be a predictable and inexpensive result. In this project, CNC machining of steel springs is the preferred approach. Standard time for 3D modeling is from 1 hour to several days; depending on what additional information must be entered and what additional calculations, etc., must be performed in order to provide the required "movements". When the NC project is ready, the control system must provide reliable functions. This means the use of the CAN protocol and independence from the iron device on which the parts are processed. As a result, the software can include general machining features as well as features that are useful for turners, millers, and more. However, due to the limitations of the CNC protocol, this approach has its drawbacks. In addition, the CAN protocol has a certain standardization, which makes it easy to improve. However, if the CNC system cannot provide enough functionality, it can bring some difficulties in the programming and learning process. For example, for all parts in the top three standard sizes (round and square), CNC should be sufficient. On a CNC machine with 4 jobs, parts with the required dimensions can be produced. However, for machining parts on a machine, one operator cannot be used as a programmer. In the Cn
