Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps. See AutoCAD's Design Suite for other related software. The original version of AutoCAD had two parts: an applications program and a drawing file. The drawing file was a 2D or 3D drawing saved in DWG or DXF format, containing lines, arcs, circles, polylines, polygons, and many other geometric shapes. These drawings could be edited, saved, printed, and edited again. Autodesk later created an enhanced version of AutoCAD called AutoCAD LT, adding features like layers, text, and 3D drafting. AutoCAD LT is no longer available, having been superseded by AutoCAD 2018. The original version of AutoCAD had two parts: an applications program and a drawing file. Drawing Wizards are very useful tools to facilitate creating drawings, particularly in AutoCAD Cracked Version LT. Visual LISP and AutoLISP AutoLISP is a visual programming language that allows users to create, manipulate and customize features within an AutoCAD application. When selecting a block in the Block Editor, a user would see a list of options, similar to what is offered by a graphical user interface. These include the placement of the block, the scaling, rotation, reflection and mirroring of blocks. The default type of block (no file extension) can be selected by pressing the "Block Type" button. This would change the block's type from a title block, to a folder, to a block that provides parameters for an object. In order to control the block's properties, a user would select it, press "Info" and "Property Options". AutoLISP allows the user to edit the block's properties within this dialog box. This includes the block's color, fill, linetype, lineweight, scale, style, thickness, visibility, and rotation. The user can also change the position of the block on the screen. This can be done by changing the block's "Position" property in the "Info" tab of the Property Editor. Visual LISP (V-LISP) allows the user to create macros, which can be used in block definitions to automate repetitive tasks. For example, the user could create a macro that identifies the type of a block and rotates it the correct amount. This would be created by creating a script file. In the block's "Info" tab in the Property Editor, there is a tab labeled "Macros". Under this tab, a user can create a new script file (text document) and use the mouse to point to the block. When the user presses "Create", a macro definition script will be created. The user would also need to know the name of the macro they want to create, the name of the block they want to add this macro to and the location of the script file. Once all of this information is known, the user can select "Save" to save the script. The user would then have to open the script file, which will display the macro in a macro definition window. The user would need to select

the macro and press "Run". AutoLISP allows the user to execute the macro definition several times and create as many macros as desired. The block editor allows users to a1d647c40b
