Battle for the future of healthcare: the SPINE brings you into the future of modern surgery. This firstperson action game captures the surgical reality and lets you experience it like never before. Step inside a game where the most advanced surgical tools from the future are used to perform the ultimate operation in the most challenging environment. Because of the complexity of the surgery process, some tools have to be upgraded before being used.While progress is made to maintain or repair the patient's vital organs, it is your duty to fulfill the surgeon's orders efficiently, and to protect the patient's life as long as possible. - 250 digital players
- Boss mode
- Multi-player mode
- 4 participants
- 24 surgeries
- 20 surgeries

- 5 special effects
- Cool 3D sound effects and background music
- 2-sided controller
- 2 controllers
- Dual screen support
- English voice

Re: B. Braun Future Operating Room **verveve** In session ## 4116 In session Joined: 21 Jul 2010 Posts: 682 The game is here!! I am in love with it. The sizing is just perfect. The weight is just right. The controls are terrific. Overall just a great game. It's only 20 bucks on STEAM. Re: B. Braun Future Operating Room **vervee** In session ## 4116 In session Joined: 21 Jul 2010 Posts: 682 Thanks Travis. B. Braun is doing great that a game can maintain it's position like it did in the arcade. I'm really looking forward to more of their games coming out. I'll be keeping an eye on them out of respect. Are there any other problem with the game? If the need arises I can contact the developers and try to get it fixed. I'm sure they want to see the game out there as is so it's just a matter of time before they fix the player (and graphics) problems. Last edited by XLDude13; 21 Jul 2010 at 03:23 AM.

What's new:

Programme, Germany, which included a healthcare-job aids package. Fifteen year audiotaped interviews with senior management, scientists, students, and patients were conducted and coded to explore the workings of the package. Audiovisual material was made available on the World Wide Web. A discussion ensued in which the authors and participants translated the findings into text for each focus group. Ten of the medical students, 10 of the senior management team, 5 of the scientists, and 5 of the patients were interviewed. A method of non-veridical narration was used in which participants were interviewed with small group discussion and contact-chats and their responses were duly noted and noted verbatim. Thematic content analysis was then used to analyse the data. The thematic analysis revealed 1) using the World Wide Web as a lifelong learning and career promotion tool; 2) difficulties in identifying a suitable business model, and hence a sustainable, commercially competitive future for the company; 3) a focus for corporate social responsibility (CSR) from within a commercial environment; and 4) an analysis of attitudes of senior management towards medical education, which showed a distinct interest in preserving hospital medical activities and increasing the hospital-based medical market share (over 14%). Commendably, all three groups involved in the World Wide Web development supported and advocated its use. Participants in all groups described some way in which the World Wide Web was a better source of information than sources already used. Attitudes of senior management of the present company towards medical education in general and the World Wide Web in particular are currently a source of concern and a desire for change. rtable and wearable multi-modal hearing/visual assistive technology troke survivors. Existing assistive technologies such as hearing and on aid equipment may not be effective and/or suitable for stroke ivors since they are not designed to meet their clinical needs such as sing long-term survivors' preference of their preferred munication mode (auditory vs. visual), power consumption, need for licity and portability. To this end, a novel haptic and visual assistive nology (VAT) was designed and tested with a stroke survivor who unable to produce a speech sound due to the consequences of a ke. A patient-centred design methodology was used to develop a rable VAT. The setup was based on a method of exploring the king skill of a haptic device to allow the trajectory information to be l as an input signal for a computer aided lipreading tool. However, use of a different haptic force with a single-axis instead of multi-axis ator resulted in the virtual lips projected on a plane instead of a ere as per the experimental setup. This caused the haptic lip back being perceived as spatial rather than temporal. The actual ke survivor's facial movement in retronasal consumption of his/her erred food displayed on a computer screen was hence replaced by ped lips onto a sphere in order to create a virtual face using two ensions corresponding to the face's top and bottom, thereby iding assistance for lipreading.Biochemical recurrence after radical tatectomy: is impaired preoperative testosterone production the
