And one more note about using this tool, you can download it from this forum using the following link.

Cytomegalovirus, Epstein-Barr virus and human herpes virus 8 in paediatric cutaneous T-cell lymphoma. To determine the prevalence of cytomegalovirus (CMV), Epstein-Barr virus (EBV) and human herpes virus 8 (HHV-8) in paediatric cutaneous T-cell lymphoma (CTCL) in the UK and examine their contribution to disease pathogenesis. Archival CTCL tissue from 23 cases (12 adult and 11 childhood) were examined for the presence of CMV (early and late antigens), EBV (early antigens) and HHV-8 (latency-associated nuclear antigen), using immunohistochemistry (IHC). EBV was detected in the majority (76%) of cases using IHC, with viral antigens present predominantly in the lymphoma component of tumours (mean 43% positive, range 3-78%). HHV-8 was present in 5 out of 8 children with a mean positive component of 24%, median 0.8%, range 0.2-51%. The prevalence and distribution of CMV and EBV were similar in adult and childhood cases, but the presence of HHV-8 was associated with disease type in children ( $p=0.005$ ). The presence of HHV-8 was more frequent than previously reported and further studies in larger series are needed to establish the prognostic significance of HHV-8 in CTCL.

Touch-sensitive controls, such as those commonly found in modern day electronic devices such as smart phones, tablets, and in-vehicle infotainment systems are becoming increasingly familiar. These controls rely on sensing techniques such as capacitive, resistive, and/or optical sensing, and may be used to make menu selections for various functions within the device, provide feedback, and generally control the device's operation. Another type of touch-sensitive control is a passive touch surface such as a table, desk, or other horizontal surface that may be used to control a device by pointing at the surface with a finger (or other object) to interact with the device. The performance of passive touch surfaces is generally regarded as only moderate due to various factors, such as the imprecise pointing, the presence of small protrusions or
