In this example, we have changed the picture's location from "Location" to "Picture". Next, choose the "Image Adjustments" tab and the "Special Effects" button. When you click on this button, you'll see that there is a small thumbnail of a picture that's been edited with special effects. The default picture is a preset picture that's included

in Photoshop Elements. When you click on the thumbnail, you'll see that there is a small preview of the image. Q: How to get a memory location that has been deleted? Using this approach I can't get a memory location that has

been deallocated. (I'm using GDB 7.7 on Linux). Now, I know that this can happen when you call malloc() and call free() on the same memory block. But I'm confident that, in that scenario, there would be some obvious pointer value (like the address of the pointer in the stack). If that is the case, how can I get that pointer? bool is_valid(char *address) { if (address == NULL) { return false; } if (is_valid_relocated_address(address)) { return true; } return false; } bool is_valid_relocated_address(char *address) { char *test_memory = static_cast(malloc(sizeof(char))); char *location_to_look = test_memory; while (location_to_look != NULL) { if ((location_to_look - test_memory) (realloc(location_to_look, 1)); if (location_to_look == NULL) { return false; } } return false; }
