Assessment of gene expression by RT-PCR: validation and optimization of RNA sample preparation from formalin-fixed paraffin-embedded tissue. A current obstacle to the use of gene expression profiling on archival material obtained from clinical specimens is the need to resort to formaldehyde fixation. In this study, we optimised and validated our procedures for the efficient isolation and quantitation of RNA from fixed paraffin-embedded tissue using a panel of candidate genes from various sites of tumor origin. After optimisation of the extraction procedure, we showed that the RT-PCR-based detection of mRNA in paraffin-embedded tissues is quite stable at this stage. The integrity of RNA recovered from two different fixatives and two different "fixatives-free" protocols was assessed using serial dilution analysis. The levels of "fixative-associated" mRNA were not significantly higher than those measured in samples fixed in formalin and stored under similar conditions. In addition, RNA concentration, specificity and detection rate were compared between four distinct PCR methods. The level of specificity and detection rate were similar for all methods used. Quantitative real time RT-PCR (TaqMan) was demonstrated to be the most appropriate method as it was most sensitive (100%) and detected the lowest number of genes. Our results demonstrate that collection and fixation of diagnostic pathology material has similar and important implications for the gene expression studies using archival material as compared to other retrospective tissue analyses. Furthermore, the storage of archival material using these techniques represents a cost-effective method of ensuring the utility of archival material for future clinical studies. Calcium-dependent control of cytosolic free calcium concentration in the endoplasmic reticulum of the yeast *Saccharomyces cerevisiae*. The basic features of Ca²⁺ transport across the ER membrane were investigated in *Saccharomyces cerevisiae* cell suspensions. The [Ca²⁺]_i changes in response to extracellular Ca²⁺ additions and

Q: How to set access to all users and full access permission for only database in SQL Server? It might sound silly, but I am trying to find a way how to set all users access to a database in SQL Server. Also, I want that only users with highest permissions would be able to access data from this database. A: I want only users with highest permissions would be able to access data from this database. I have created a user in mySQL with this type of permission: SELECT, INSERT, UPDATE, DELETE FROM db1.mytable GRANT ALL PRIVILEGES ON db1.* TO [user]@[localhost] After that I have created a database in SQL Server with the same user and granted all permissions for the user (just like in MySQL). Then I have created a simple ADMIN SQL script which inserts my data: CREATE TABLE db2.mytable (myID INT IDENTITY(1,1) NOT NULL, myValue VARCHAR(20) NOT NULL, CONSTRAINT mytablePK PRIMARY KEY (myID)) INSERT INTO db2.mytable 6d1f23a050
