the feature you asked about is available on most 3d cad software. in the menu, there is a tool for creating multi-file parts. it is very useful for parts that are cut from larger raw materials. this function also works between different cad software, such as solidworks, inventor and so on. in this case, you need to open several files in one part and then export these files separately. looking at the documents for this software, it appears that the camworks software was not designed to work on windows 7. the software will not work correctly if windows 7 is selected as the operating system. if you are still having issues, try the following troubleshooting steps: make sure that you have only one instance of the biesse.biesseworks.dotnetinit.dll file in your computer. if you do have multiple copies of this file, please delete any of the invalid files and restart your computer. close all open applications and restart your computer. reboot your computer into safe mode with networking and make sure that you don't have the internet connection enabled during the boot process. if you are running windows 10, please make sure that you have the latest windows updates. if you are running an older version of windows, please update your operating system. reinstall third-party application using the microsoft's own utility, the automatic (control panel -> programs -> uninstall a program). if you are running windows 8.1, please run the command prompt as administrator. open windows explorer and navigate to %appdata% (this is the folder where third-party applications save their data). rename biesse.dll to biesse.old.dll and copy biesse.dll back to %appdata%. open your third-party application and check if the issue is resolved.

we are proud to announce the latest version of our software, camworks 5.5. we have listened to your comments and worked to improve the functionality of the program. you can now share your files directly to the cloud using the simple and easy to use embed functionality. its been a while since the purchase. i have been using it without any problem. i had to update the third party software, but that was easy to do. a big help was the free dll download (no license needed). its been a very positive experience so far. just wish the more features were added. hi everyone. i have an issue. i am trying to use the editor and my pc crashes. i ran memtest and it found nothing, i run the latest driver and it found nothing. i

have a pentium 4 2.4 ghz, 512 megs of ram. i have tried changing the software to .net 1.1, .net 2.0, .net 3.0. i have changed the third party.dll to .1 and. i have changed the db size. i have also changed the registry. i have changed some of the third party tools. i even have tried to delete all third party tools and start from scratch. nothing seems to work. i have tried everything! i am also having the same issues as the op. i have purchased the software but it does not work. no matter what, i cannot get the software to work. i have followed the instructions given but nothing works. i have left the software on for hours and still nothing happens. i have even uninstalled and then reinstalled but still nothing happens. it is ridiculous that a piece of software is so expensive and still the manufacturer does not want to support it or the customer. if you had paid the \$99.99 for the software, you should get some support or something to work. you are paying for the software to work. i am not a programmer or anything, but i know what i am paying for when i pay \$99.99 and it does not work. it's not just me either. a lot of people are having the same issue. 5ec8ef588b
