Image editing takes on many forms. In the 1960s you might have used an old-fashioned floppy disk to transfer your edits, but now we need networked computers because no, no, even your telephone doesn't have enough storage. Of course, today's flatbed scanners don't have any room for floppy disks. You can still transfer your files, but you can't carry around piles of floppy disks anymore. As a photographer, I've tried to deserve a true professional image editor. It made sense to use the same editor that I used for editing in-camera, and which I used for modifying my RAW files afterward. Fine, the "RAW" files you see on the Canon and Nikon websites are not the RAW files I use professionally—those are the JPGs they are marketing to you. But you still expect, in the right circumstances, I'll edit those files as well if you send a few hundred pounds my way. Online editing is one way of bringing Photoshop into the digital age, a huge leap for any niche product, but in this day and age the digital workflow is still going strong because the people using it are invested in the tools they're using and know how to use them. They understand the workflow between the file and the output (output is the finished product). A DIY workflow is not quite as robust and looks a little messy. The snapshot feature has been around in Photoshop longer than Lightroom, and was one of its key silent features, because it provided a way for Photoshop customers to get their public reviews quickly and easily. This was a win-win for everyone, and Photoshop was the only one who had it.
