Phoners newsletter: Get news, tips and insights on. 5/13/20 10:49 AM. WORLD SERIES GAME 1. Laya yang bersifat nomor-Q: Why are there so many species-specific papers in ecology, but no (much) process-based papers? I keep seeing a recurring pattern in papers where the authors declare that they studied species X under condition Y, with the aim of understanding the relationship between species X and condition Y. The paper I'm thinking of mentions that the animal always sat on the clutch of the same type of nest-building woodpecker as adults. These papers are very interesting because the animals always obey the same rules, and the answers are always the same. But I find that I never come across any papers of this kind that use an ecological process rather than a mechanistic process. The number of papers of this kind that I can find rapidly decreases as the analysis becomes more complex - for instance, if you look at papers that study the relationship between diversity and productivity in a natural system, the vast majority are mechanistic analyses, but there are very few that look at ecological processes. Why is this so? Are we so fixated on using the SR²s to predict species distribution that we've totally given up on any process-based analyses? A: I do not have access to the papers that you are referring to, so I hope to find the answer to your question elsewhere. However, it seems to me that there are at least three reasons for this. 1) Because to study ecological processes one must think at least about the function of a system and how it changes over time. If one does not want to do this, he/she studies in that paper only the species abundance (a number) or the size (a length, height or whatever) of individuals belonging to the system. This is not at all interesting if one wants to understand how the system functions. 2) One needs to change the state space to make the studies of the ecological processes. This is difficult, for instance, in small scales (and maybe more difficult at the system scale). 3) Finally, to study ecological processes, one needs to see an order
